

Formed bag

Gambo bag

Q bag

Q-Bags are constructed by corner baffles to maintain their cubic form once they are filled. The corner baffles are made to allow the material to flow smoothly into all the corners. Because of their cubic shape, q-bags require less storage space and cut down the transportation costs up to 30% compared to the regular big-bags.

Gambo bags are also used for the same purpose but have a slightly different construction than q-bags. The cubic shape of the Gambo bags is formed by an inner layer, which cannot be observed from the outside. Gambo bags have two advantages over q-bags: better sift proofing and better appearance. The Gambo design is patented by Gambo B.V. and Cesur is an authorised licensee.
