

1 & 2 Loop bag

One & Two loop FIBCs are less complicated and more economical in comparison with Four loop FIBCs . They are produced out of Tubular body fabrics to obtain a higher breaking strength. Top lifting points are wrapped with sleeves which can be made in different colors to identify the products inside the bags. Colored sleeves make also the lifting points more visible for the truck operator to easily handle bags by a hook or a fork of a fork truck. Most commonly used designs are open top with PE liner inserted, coated designs are also available with spouted tops. There are also various base designs like square base, star base, and straight seam base, discharge spouts can only be applied to square base. For manual filling machines bags are packed on pallets however they can also be wound on rolls to be used on automatic filling stations.
