

# Standard FIBCs

## Cross Corner Loop

## Side-seam Loop

FIBCs are one of the most cost effective and ideal type of packaging for shipping and storing dry bulk products. They are produced from polypropylene tubular or flat woven fabrics both coated and uncoated, varying in different weights depending on their SWL (Safe Working Load) and SF (Safety Factor). An FIBC can be as simple as an open top and flat base used in the building industry or as hi-tech as clean room production to be used in the pharmaceutical industry. They all have one thing in common: they are custom made.
