

# Potato bag

# Ventilated fabric

Potato bags are produced out of ventilated PP. woven fabrics that are specially designed to permit the required airflow through the fabric into the bag. Duffle or flap is often used as a top closure and a bottom spout as a discharge facility. For potato seeds, PP. netting is used on two side panels, which allows greater air permeability.

FIBCs for potatoes, have brought great advantages to potato suppliers in handling, storing and transporting their products compared to the old fashion 25 or 50 kg. woven sacks. They are commonly used in Egypt, Israel, and in many European and Scandinavian countries.
